

Introduction:

The causal research question is: Does playing surface impact the rate and severity of player injuries in the NFL?

Data:

The response variable is player injury rate and severity, while the explanatory variable is the type of playing surface (i.e., natural grass or synthetic turf).

The data will be obtained from the NFL Playing Surface Analytics Competition on Kaggle. The dataset includes information on every play from the 2012-2018 NFL seasons, including player injury reports, game location, playing surface, weather conditions, and other relevant variables.
